ABSTRACT

The health division has seen a huge transformation subsequent the introduction of latest computer technology & this has led to added medicinal information producing various sectors of research. In recent years, there has been surges in interest in study on assessment sustain appliances in healthcare, for example individuals relating to analysis, forecast, behavior forecast, and so on. This progress is due to increased data availability, breakthroughs in artificial intelligence and machine learning research, and contact to computational assets. Data Mining and Predictive Analysis are being used by a number of healthcare organizations. Predictive analysis utilizes assortment of statistical procedures as well as representation, machine learning & data mining to approximate the future by breaking into past and current realism. Appropriate to the information ambitious environment of machine learning algorithms, artificial intelligence trends has achieved its full prospective when back up by large information positions. Our study examines the implications of current breakthroughs in information analytics and how these will be used to the healthcare industry, with a focus on analytical & prophecy applications.

KEY WORDS: PREDICTIVE ANALYTICS, HEALTHCARE, MACHINE LEARNING, LEARNING ALGORITHMS.

INTRODUCTION

During rising national healthcare costs, healthcare companies need relationships dynamically to discover ways to lower costs without jeopardizing patient results. One of the strategies to achieve these goals is by focusing

on patients who are likely to be readmitted to treatment, given that these individuals are a huge amount of administrative costs (Cucciare and O'Donohue, 2006). Government Accountability Office stated that 5 percent of Medicaid beneficiaries accounted for half of programme expenses (Quinn et al 2016). These patients generally face complex, permanent problems that are difficult to assess and control. If these patients are differentiated by healthcare providers, the latter can possibly reduce costs and help them manage their ailments better.

This research examines and perhaps benefits a strategy for distinguishing patients with and without the danger of readmission. These patients are supplied with solutions tailored to their specific needs and can be utilized to

ABSTRACT

Cold storage units preserve fresh produce for extended shelf life. Operation of cold stores at present in India is done with multi commodity and common storage chambers where compatibility of fresh produce is not taken care of. Parameters to be maintained in the cold stores are: temperature of produce, temperature of the cooling coil, air temperature, humidity level, gas composition like oxygen, carbon-dioxide, ethylene, etc. for different fruits and vegetables to be stored in different chambers. These parameters need to be closely maintained to get best storage life of the produce. Most of the storage plants in India are equipped with manual or semi-automatic controls. Centralized chambers holding all types of fruits and vegetables at one place can lead to improper maintenance of storage conditions causing reduced life. The purpose of this study is to identify the technical requirements of computerized and automatic systems, so that fresh produce can be handled on automatic material handling systems. Apple color quality was measured by an expert panel and compared with colorimeter grading system. Significant positive correlation was found between visual and colorimeter readings. Computerized systems for refrigeration systems, data logging is to be installed for careful monitoring of cooling and gas conditions inside the chambers. This will ensure fruits and vegetable stored at optimal shelf life conditions. The results of this study can help to develop software for a comprehensive cold storage warehouse management system.

INTRODUCTION

Commercial cold storage units preserve fruits, vegetables, cashew nut, raisins, red chilli, Bengal gram, ice creams, cheese, butter, meat, frozen green peas, etc. to control the spoilage and retain the quality parameters. Shelf life of these products depends on the moisture content of the product, respiration rate, temperature of the cold store chamber, relative humidity (RH) etc. Fresh produce like fruits and vegetables require low temperatures of the order

Suggestions

Generally wireless sensor networks (WSN) are connected via a wireless medium to form a large amount of cooperative sensor nodes. Monitoring control is an important aspect of monitoring users in monitoring applications, such as wireless sensor networks, because of security. There are countless applications to pay for themselves but at the same time, their special properties offer a number of challenges, such as security and surveillance, control, and operation and complex system maintenance. WSN has already seen it on the Internet, from face-to-face security attacks. To propose an Optimal Multilevel Link extend umpiring routing (OML-EUR) based secure routing protocol for improving privacy standard in wireless sensor networks. Secure communication is also important in providing accurate and resource constraints at the sensor node at the moment. In this study, there are three of our contributions. Initially it monitors the neighbor network layer attacks for browsing the WSN on the transmission medium. Followed subscription a link establishment to monitoring the request packets through key transmission of WSN with secure routing protocols. By finding the secure communication as qualities of service verification among the modes to authenticate to transfer. The proposed system produce high secure performance by the result proves energy consumption and communication overhead as higher efficient than previous system.

ARTIFICIAL INTELLIGENCE BASED INTRUSION DETECTION ANALYSIS USING CLOUD COMPUTING

¹Dr V Suryanarayana, ²P.Jagadeesh, ³A.Vanamala Kumar, ⁴Musala Venkateswara Rao

¹Professor in CSE, Ramachandra College of Engineering, Eluru

²Assistant Professor, Department of ECE, Saveetha School of Engineering, SIMATS, Chennai-602105, Tamilnadu, pjagadeesh89@gmail.com

³Prasad V Potluri Siddhartha Institute of Technology, Vijayawada

⁴Koneru Lakshmaiah Education Foundation, Vaddeswaram, Guntur-522502, India

Received: 16 March 2020 Revised and Accepted: 16 June 2020

ABSTRACT

A model for intrusion detection may be based on the methods based on an structure and focus. We will create a model for the identification of intrusion to recognise frame assaults and develop the structures using the collected information. The acquired NSLKDD information index can be decreased and the location of interruption can be enhanced by using the collected information by using the highlight determination method in AI. Through AI methods, the structure of interruption position can be created through increasing the number of new occult attacks. IDS help to shield the framework from the assailant. In this examination work, IDS is intended to recognize malevolent hub by utilizing improvement and AI (Artificial Intelligence) strategies. The information is improved utilizing firefly calculation. The firefly calculation is a meta-heuristic methodology which is motivated by the conduct of fireflies. The improvement calculation assists with finding the best element. Based on removed highlights the SVM (Support vector machine) is prepared. SVM is a double classifier which is utilized to take care of multi-class issues. In this exploration work, SVM is utilized to recognize assailant hubs and authentic hubs. Subsequently, rather than passing information to the aggressor hub, the hub passes the information to the certifiable hub and consequently, the framework is ensured. To know the presentation of the framework, QoS (Quality of administration) boundaries, for example, PDR (Packet conveyance proportion), vitality utilization rate and complete postponement with and without anticipation calculation are estimated. The execution has been done in CLOUDSIM condition.

KEYWORDS: Support vector machine (SVM), Quality of administration (QoS), Packet conveyance proportion (PDR)

1. INTRODUCTION

Since the beginning of PC organizing, interruption discovery frameworks (IDSes) have assumed a basic job in guaranteeing safe systems for all clients, yet the state of the job has changed all through late history. What started as framework overseers physically observing client exercises in the mid '70s became groups filtering through review signs during the '80s, progressing to online examination and devoted projects in resulting decades. None of these frameworks had the option to viably pinpoint assaults rapidly, nonetheless, and in this manner were commonly utilized as criminological devices to analyze security occurrences ex post facto [1]. As traffic developed and assaults turned out to be progressively common with the ubiquity of the Internet during the 1990s, it became clear that swifter interruption recognition examination was important to both analyze and forestall assaults. To achieve this, specialists attempted to all the more likely comprehend arrange traffic designs, which brought about the more prominent advancement of mark based and conduct based discovery methods. Mark based procedures contrast traffic designs with known assault marks, while conduct based methods recognize interruptions by means of deviations from ordinary or expected traffic conduct. While the two procedures can be successful continuously, huge constraints regardless exist—signature-based strategies can't make preparations for obscure interruptions, and conduct based methods separate under overwhelming traffic or unexpected traffic blasts [2].

To address these overwhelming traffic restrictions, scientists tackled the intensity of distributed computing innovation to accelerate calculation. As of late, the MapReduce registering stage, especially through the Hadoop

Verification of Speakers in Emotional Talking Environments by Considering Emotional Content

¹Dr V Suryanarayana, ²A.Madhuri, ³T. Sri Lakshmi

¹Professor in CSE, Ramachandra College of Engineering, Eluru

^{2,3}Assistant Professor, Department of CSE, PVP Siddhartha Institute of Technology, Kanuru, Vijayawada

Abstract

Voices can easily be confirmed in neutral voices, but speakers cannot be easily verified in emotional expression situations as in neutral ones. As a result, speech verification systems in both emotional and neutral speech environments do not perform. This paper used a two-stage approach to improve speaker testing performance in emotional environments and analyzed them. This architecture comprises three stages of cascade: gender recognition, emotional recognition and speech processing. To assess the proposed context in-house and data sets "emotional prosody speech and transcript" two distinct and independent emotional-language datasets were used. Our findings show that a speaker test based solely on gender, emotional details as well as sexual and emotional information is superior to any speaker test. The performance obtained by average speaking speaker based on the proposed structure is very close to that obtained by human listeners in subjective evaluation.

Keywords: Transcript, Emotional Prosody, Human Listeners

I. INTRODUCTION

Past experiments have shown how anger influences speech comprehension and compensation systems. But emotionally neutral recording compensatory approaches can negatively influence speaker recognition systems' performance[3]. If emotion compensation schemes are needed it is important to recognize. In some cases, the performance of the speaker recognition is so unlikely that this recording can best be discarded and forensic analysis is given priority over other recordings. It is important therefore to distinguish the emotional range in which the speaker's identity can be reliably recognized.

In this study (1) the reliability of a speaker recognition task for expressive expression is comprehensively analyzed and (2) the emotional classifiers are used to assess sentences with less accurate speaker recognition performances. The research first explores the efficiency of an articulate speech-recognition device. A subset of the MSP-PODCAST corpus is used for the study[7]. The body includes several hours of natural emotional

talk on audio-sharing websites from multiple speakers. The emotional contents of this corpus are noted for their emotional attributes: enthusiasm (truly calm versus very active), valence (truly negative versus very positive) and dominance (truly weak versus very strong). We analyze the performance of speaker recognition based on emotional characteristics, extending from 40 to 80 speakers our previous work. In the study, we classify areas or boundaries within the arousal-valence space and describe three levels of reliability, uncertainty and unreliability (i.e., in a certain degree of error, we may or cannot recognize the identity of a speaker).

Listeners may obtain various types of speech signals information. This type of information is as follows: I the recognition of voices that transmits information on the voice content; (ii) the recognition of the voice speaker that gives information on the identity of the speaker; (iii) the recognition of the emotional state of a speaker and of the emotions; (iv) the

Sub: Requesting for Permission - Attending Workshop -
JNTUK Kakinada - Reg.

Sir,

I am Y. Nagendra Kumar working as Asst. prof in
CSE department. For IQAC coordinators JNTUK Kakinada Conducting
one day workshop on "Quality Enhancement, Assessment and Accreditation
of Engineering Colleges" on 11/10/2019 at JNTUK University. As a
part of that from our college I am attending for workshop. So I
request you to kindly give permission to attend workshop. Kindly
provide an amount of 1000/- for TA & DA.
Thanking you.
